Run the above procedure by hand on the initial permutation (1, 2, 3, 4) and see that it does indeed produce all 24 permutations of the set {1, 2, 3, 4} in lexicographic order. Also check that (4, 3, 2, 1) which is the final permutation in lexicographic order, is returned to the initial state (1, 2, 3, 4).

Finding Diagonal Attacks
Your program will also include another function with the following heading.

```
static boolean isSolution(int[] A) { . . . }
```

This method will return true if the permutation represented by $(A[1], A[2], A[3], \dots, A[n])$ places no two pieces on the same diagonal, and will return false otherwise. To check if two queens at $(A[i], i)$ and $(A[j], j)$ lie on the same diagonal, it is sufficient to check whether their horizontal distance apart is the same as their vertical distance apart, as illustrated in the diagram below.

horizontal distance = $6 - 2 = 4$

vertical distance = $7 - 3 = 4$

Function `isSolution()` should compare each pair of queens at most once. If a pair is found on the same diagonal, do no further comparisons and return false. If all $n(n-1)/2$ comparisons are performed without finding a diagonal attack, return true. (Question: why is the number of 2-element subsets of an n element set exactly $n(n-1)/2$?)

Program Operation
Your program for this project will be called `Queens.java`. You will include a Makefile that creates an executable Jar file called `Queens`, allowing one to run the program by typing `Queens` at the command line. Your program will read an integer n from the command line indicating the size of the Queens problem to solve. The program will operate in two modes: normal and verbose, indicated by the command line option `-v`. In normal mode, the program prints only the *number* of solutions to n -Queens. In verbose mode, all permutations representing solutions to n -Queens will be printed in lexicographic order, followed by the number of such solutions. Thus to find the number of solutions to 8-Queens you will type:

```
% Queens 8
```
